**ABSTRACT**

The incidence of the illness is too high in India as the cities here are exposed to some of the highest air pollution levels in the world. Added to this incidence of this illness, it may be crippling by virtue of its episodic, chronic course incapacitating the patient in his occupation. Moreover, as Acarya Caraka says the disease tend to incriminate the heart in the long run threatening one's life. This illness is found to be mind boggling to the physician even. In spite of prescribing best available medicine, the complete cure proved impossible in many. Further, in some, managing the attacks seems to be difficult. In spite of weeping and wailing of the patients the physician's sincere attempts tend to be vain. This is true for the conventional medicine and for any of the alternative medicine. Vata and Kapha are the two key pathological factors involved in the Samprapti of Tamaka Svasa demands distinct remedy and hence writing a prescription in such a situation is wheels in wheels. Dhumapana is one of the line of treatment is explained in Caraka Samhita. Dhumapana has its own importance as the medicine is directly delivered into the Pranavaha Srotas and there by initiates rectification of morbidity. Thus, this comparative study planned to evaluate the therapeutic effect of Haridra Dhumapana and Svasakutara rasa in patients suffering from Tamaka Svasa. Total 20 patients were included and treated with observevaion of 7 days under two groups (dhumapana group & Svasakutara ras grop). Finally, it was concluded that Dhumapana grop comparatively better relief to the patients of Tamaka Svasa.

Keywords: Tamaka shvasa, Dhumapana, Asthama, Svasakutara ras

INTRODUCTION

The presentation of the *Pranavaha Srotas* disorders is more emblematic. Among which Tamaka Svasa is one, well known for its episodic chronic course [1]. In modern parlance, this illness is best compared to Bronchial asthma. A recent publication by the “The global burden of asthma report” [2] reveals that about 50 million people suffer from Bronchial asthma in Central and Southern Asia. The report also predicts the prevalence of the illness tend to increase in the coming years. It also points out that the increase in prevalence of the illness is due to increase in industrialization as well as urbanization. “*Visheshat Durdina Tamyethi Svasaha Sa Tamaka Mataha*” [3] The attack of Svasa with *Tamaprapvesh*, which occurs especially during *durdina*, is referred by the name *Tamaka Svasa*. “*Svasasthu bhashthrikadmana samavathordwa gamini*” [4]

This means it is a disease where the expiration of air produces a sound similar to the sound of bellow of black smith. These features are similar to that of Bronchial asthma in modern parlance. The word Asthma is derived from Greek, which means hard drawn breath or panting. Briefly, the union of two words *Tamaka* and *Svasa* forms the word *Tamaka Svasa*. *Tamaka* refers to the darkness in front of the eyes or else the disease predominating at night hours. *Svasa* refers to labored breathing producing sound.

Along with so many *Ahara* (food) & *Vihara* (activity) factors, some of the environmental factors include cold weather, cloudy weather, dust, smoke etc. In addition, every person living in this environment is exposed to these etiological factors of the *Tamaka Svasa*. However, it is observed that in a hostile environment only the patient suffering from the *Tamaka Svasa* will develop the attack of *Svasa* and not all the persons.

Samprapthi: Predominant morbidity of *Vata* and *Kapha Dosha*, morbid *Dosha* stemming out from *Pit-tasthana*, affliction of *Rasa Dhatu*, disturbed functioning of the *Pranavaha Srotas* are the hall marks of pathogenesis of *Tamaka Svasa*. And this unique pa-

thology determines episodic nature of the illness that runs a chronic course and in the long run incriminating the *Hridaya Marma* the root of *Pranavaha Srotas*.

Pathologic cause of symptom manifestation: Accumulation of *Sleshma* when obstructs the *Pranavaha Srotas*, it predisposes to productive cough and is a predominant symptom of *Tamaka Svasa*. As the sputum is brought out, the obstruction is temporarily relieved and hence the patients feel easy to breathe. The morbid *Kapha Dosha* in conjunction with *Rasa Dhatu* causes abnormal production of *Sleshma* in the *Pranavaha Srotas*. This *Sleshma* is described as thick, sticky and tenacious and thereby contributes the obstruction in the *Pranavaha Srotas*. Excessively secreted tenacious *Sleshma* is expectorated out with much difficulty during the bouts of coughing. The *Kanta Ghurghuraka* or the rattling sound is also suggestive of increased *Sleshma*. [05]

Rupa [6-14] *Svasa, Kasa, Kapha Nistivana, Kantha Gurghuraka, Peenasa*

Onset: Sudden onset and rapid development of an attack of breathlessness is characteristic of *Tamaka Svasa*. Alternatively depending upon the virulence of Doshic vitiation the mode of onset may vary from insidious, gradual to acute manifestation. Manifestation of the *Rupa* of *Tamaka Svasa* preceded by the occurrence of *Poorvarupa* that are mostly related to *Annavaha Srotas* and *Pranavaha Srotas* is the typical onset of the illness. In some patients, the episode of *Tamaka Svasa* may start with *Peenasa* and related symptoms. In some others, irritant cough may be the initial symptom. Yet other patients may have trouble in breathing in the form of tightness of the chest, followed by the development of other symptoms.

Severity: Depending upon the amount of Doshic vitiation and its virulence the severity of an attack of *Tamaka Svasa* may vary from attack to attack. The individual attack may be mild, moderate or severe. In a worst attack, the patients' speech is restricted to a word or even lesser than that. Along with this perspi-

ration may also be seen on the forehead. At times, the consciousness of the patient may deteriorate.

Course: Depending upon the exposure to the predisposing factors the illness shows recurrent attacks of *Tamaka Svasa*. When the disease runs a chronic course, due to the damage to the *Pranavaha Srotas*, the episodic nature of the illness may cease; rather it will become a continuous illness. In the terminal stages, the pathogenesis extends to the *Hridayamarma* and hence the symptoms of *Hridayamarmabhigata* may supervene.

Dhumapana: Smoking for the therapeutic purposes using a specially designed instrument or pipe is known by the name *Dhumapana*. Using a special instrument, the herbal powders are burnt, and the smoke emitted is inhaled. [15] The accumulation of the *Kapha Dosh*a in the head as well as respiratory system is best cleared by this procedure. Following *Vamana karma* and *Nasya Karma* therapeutic smoking is practiced as a follow up procedure. In disorders like *Tamaka Svasa*, *Peenasa*, *Sirasula* therapeutic smoking is an effective treatment in relieving the symptoms by clearing the passages. [16]

Method of administration of Dhuma.

To begin with the patient is thoroughly examined to confirm the indications as well as to rule out any of the contraindications. Then the patient is made to sit in a knee highchair with his body erect and looking forwards. He should have full concentration on the therapy and should not have any reason for distraction of mind like *Kama*, *Krodha*, *Bhaya* etc. The *Dhuma*-yantra is prepared and its functioning is assessed. Then the patient is asked to inhale the *Dhuma* through the mouthpiece of the instrument. And then the patient is allowed to exhale the *Dhuma* only through the mouth. If the patient has symptoms related to the nose and head, the *Dhuma* may be inhaled through the nose and is once again exhaled through the mouth. When the patient inhales three puffs of *Dhuma* it is counted as one bout of *Dhumapana*. Patient is allowed a small pause between each bout of smoking. In these way three bouts of *Dhumapana* is carried out in a single sitting. During the procedure if the sputum comes out the patient is asked to spit out the sputum.

Methods

Aim of Study: This study is planned to evaluate the therapeutic effect of the *Haridra Dhumapana* in patients suffering from *Tamaka Svasa*. Following are the objectives of the study.

1. To evaluate the *KaphaVatahara* effect of *Haridra Dhumapana* and *Svasakutara rasa* in patients suffering from *Tamaka Svasa* and there by assessing the therapeutic effect of these medications in bringing symptomatic relief.
2. To explore the efficacy of the combination in the management of *Tamaka Svasa*.

Source of Data: The patients who attended the OPD and IPD section of our Ayurveda hospital having the symptoms like breathlessness and cough with a tentative diagnosis of *Tamaka Svasa* were screened. Among these patients only 20 patients who fulfilled the below mentioned criteria of inclusion were taken for the study. While selecting these 20 patients care was also taken to see that there was not any factor in these patients listed in the exclusion criteria. The selected patient's detailed profile is prepared as per the detailed proforma designed for the same purpose, which incorporates relevant data like symptomatology, physical signs, laboratory investigation reports, as well as assessment criteria.

Plan of the Study: In the present clinical study, a total number of 20 patients suffering from *Tamaka Svasa* were taken from OPD and IPD of our Ayurveda College Hospital. All the 20 patients completed the scheduled regimen. In these patients the diagnosis was based on signs and symptoms of *Tamaka Svasa* as well as spirometric parameters. As a routine, Hematological investigations were carried out in all the patients taken for the study. The selected 20 patients were segregated in two groups irrespective of their age sex or cast. Each group consisted of 10 patients. The first group consisting of 10 patients is treated as test group and is named as *Dhumapana* group. The second group is taken as control group and is called as *Svasakutara rasa* group.

The patients of *Dhumapana* group were subjected to seven days course of *Haridra Dhumapana* along with oral administration of *Svasakutara rasa* in a dose of

250 mg thrice daily for ten days. The patients in the *Svasakutara rasa* group were treated orally with *Svasakutara rasa* in a dose of 250mg thrice daily for consecutive ten days.

Inclusion Criteria:

20 patients taken in this clinical trail were according to the following Inclusion criteria: -

1. Patients with *Pratyatma Lakshana* of *Tamaka Svasa* with the positive spirometric test for Bronchial asthma.
2. Patients age group between 12 to 70 Years.
3. A history of 6 months breathlessness, or more.

Exclusion Criteria:

The patients suffering from *Tamaka Svasa* showing the presence of following criteria were excluded from the study.

1. Patients below 12 years and above 70 years were excluded from the study.
2. Patients of *Tamaka Svasa* who also suffer from other systemic disorders like tuberculosis, diabetes mellitus, HIV, hepatitis, hypertension, complications of Bronchial asthma like Emphysema, Cor-pulmonale etc.

Investigations: Following is the list of investigations carried out in 20 patients of *Tamaka Svasa* taken for this study.

Blood- TC, DC, ESR, Hb %, other investigations if needed

Routine urine analysis

Spirometric test

X-ray done wherever necessary.

Design: It is a single blind comparative clinical study with pre-test and post-test design. In this study 20 patients suffering from *Tamaka Svasa* of either sex of age group between 12 to 70 years were selected. These patients were randomly allocated into two groups. First test group is the *Dhumapana* group and in short, this group is referred as DPG. *Svasakutara rasa* group is the second group and is also the control group. This control group is also referred as SKG in short.

Intervention: In the *Dhumapana* group the patients were subjected to *Haridra Dhumapana* in a dose of one sitting per day for consecutive 7 days. Along with

this *Svasakutara rasa* was orally administered in a dose of 250 mg tid for ten days. This was the test group.

In the second *Svasakutara rasa* group, i.e. control group *Svasakutara rasa* was orally administered in a dose of 250 mg tid for consecutive 10 days.

Assessment Criteria: The improvement or otherwise following the above said medication in the two groups was assessed before and after the treatment by adapting the standard methods of scoring the subjective as well as objective criteria. The spirometric evaluation of pulmonary ventilation was also carried out both before and after the treatment. The full account of the assessment criteria is elaborated in the following lines.

Severity of Tamaka Svasa:

1. **Mild intermittent:-** Symptoms-symptoms <2 times a week, asymptomatic and normal PEF between exacerbations, brief exacerbation (few hours too few days), and intensity may vary, night time symptoms < 2 times a month, lung function – FEV₁ or PEF 60% to 80% predicted, PEF variability>20%
2. **Mild persistent:** - Symptoms- symptoms > 2 times a week but < 1 time a day, exacerbation may affect activity, nighttime symptoms > 2 times a month, lung function - FEV₁ or PEF 80% predicted PEF variability 20% to 30%.
3. **Moderate persistent:** - Symptoms - Daily symptoms, daily use of inhaled short acting beta2 agonist, exacerbations affect activity, exacerbations>2 times a week, may last for few days, lung Functions - FEV₁ or PEV 60% to 80% predicted, PEF variability > 30%.
4. **Severe Persistent:** - Continual symptoms, limited Physical activity affected with frequent exacerbation, nighttime symptoms – frequent, lung function - PEV or PEF < 60% of predicted, PEF variability > 30%.

Breathlessness: Mild - Breathlessness with activity. Moderate - With talking. Severe - At rest. Impending respiratory failure-Breathlessness at rest.

Speech: Mild - Sentences. Moderate – Phrases. Severe - Words. Impending respiratory failure - Mute.

Cough:

- Morning bouts or after exercise - Do not disturb work.
- Continuous cough during day and morning - Disturbing work.
- Continuous day morning and night cough - Disturbs activity.
- Continuous day, night and sleep and activity disturbed.

Sputum:

Less than 2.5ml/day.
 2.5 ml to 1.5ml/day
 15 to 25ml/day
 > 25ml/day.

Body position:

Mild - Able to recline.
 Moderate - Prefers sitting.
 Severe - Unable to recline.
 Impending respiratory failure - Unable to recline.

Respiratory Rate:

Mild - >10/min
 Moderate - >20/min
 Severe - After > 30/min
 Impending respiratory failure > 30/min

Labored breathing:

Mild - Usually no use of accessory muscles.

Moderate - Commonly use of accessory respiratory muscles.

Severe - Usually use of accessory respiratory muscles.
 Impending respiratory failure - Paradoxical thoraco-abdominal movement.

Breath sounds:

Mild - Moderate wheezing at mid to end expiration.
 Moderate - Loud wheeze through out expiration.
 Severe - Loud inspiration and expiratory wheezes.
 Impending respiratory failure - Little air movement without wheezes (silent chest).

Spirometric Tests: Computerized electronic kit micro spirometer was used in this study for assessing pulmonary ventilation capacity. The technical features of this spirometer included-

Flow meter: Bi-directional digital turbine.

Range for flow measurement: 0.03 - 20 l/s
 Range for volume measurement: 10l
 Accuracy of measurement: 3% or 50 ml

Dynamic Resistance: @ 12 l/s < 0.7 cmH2O/l/s

The interpretation of the predicted values for spirometric lung volumes was calculated and following the ERS 93 criteria (Official Statement of the European Respiratory Society, The European Respiratory Journal Volume 6, Supplement 16, and March 1993.) following is the list of spirometric tests, included in the present study on *Tamaka Svasa*.

Symbol	UM	Parameter
FVC	l (btps) Forced xpiratory	Vital Capacity
FEV1	l (btps) Forced xpiratory	Volume in 1 second
PEF	l/sec Peak Expiratory	Flow
FEV1/FVC%	FEV1	as a percentage of FVC

Assessment of Overall effect: For assessing the overall effect of the treatment, the total scores of criteria of assessment of *Tamaka Svasa* after the treatment was considered. As per the reduction in the total scores of the overall effect is calculated as under:

Complete remission – Total score is 0 after the treatment.

Moderate remission – Reduction in more than 60% of the initial score.

Average remission – Reduction in score between 30 to 60%.

Unchanged – Reduction less than 30% of the initial score.

Briefly, this assessment criteria incorporates almost all the subjective as well as objective clinical manifestations of the illness *Tamaka Svasa*.

Observations and Results: A total of 20 patients suffering from *Tamaka Svasa* fulfilling the inclusion criteria were taken for the study. All these 20 patients who registered have completed the stipulated schedule of the study. These patients were randomly categorized into two groups of ten patients each irrespective

of their age cast of creed. Ten patients were studied in the *Dhumapana* group and was the test group. Remaining ten patients were studied in the *Svasakutara* group and was the control group.

Effect on Severity in *Dhumapana* Group

Following the treatment with *Dhumapana* the mean severity, score of *Tamaka Svasa* came down to 1.0

from the initial score of 2.4. The difference in mean score before and after the treatment has shown a definite improvement. The improvement was proved highly significant by the paired t- test as shown in the Table 1.

Table 1: Effect on Severity in patients of *Tamaka Svasa* in *Dhumapana* Group

Mean		Difference In Means	Paired 't' test			
B.T.	A.T.		S.D.	S.E.M.	't'	P
2.400 (±0.699)	1.400 (±0.843)	1.000	0.667	0.211	4.743	=0.001

Effect on severity in *Svasakutara rasi* Group: Patients treated with *Svasakutara rasi* have shown reduction in the severity following treatment. The initial mean score of severity, which was 2.6 before the treatment, came down by 0.7. This improvement was

also found to be statistically significant proving that the change after treatment is not because of a chance factor rather by the definite effect of the medication. A different statistical value related to this analysis is given in the Table 2.

Table 2: Effect on Severity in patients of *Tamaka Svasa* in *Svasakutara rasi* Group

Mean		Difference In Means	Paired 't' test			
B.T.	A.T.		S.D.	S.E.M.	't'	P
2.600 (±0.516)	1.900 (±0.568)	0.700	0.675	0.213	3.280	=0.010

Effect on Dyspnoea in patients of *Tamaka Svasa* in *Dhumapana* Group: Mean score of severity of dyspnoea before the treatment was 2.0 and this came down to 1.2 following the administration of *Dhumapana*. An improvement by 0.8 scores following the treatment was proved to be statistically significant by the paired

t- test. Or to say the favorable response to the treatment cannot be due to any chance factor rather the *Dhumapana* is effective in relieving the dyspnoea. The details of the statistical results are presented in the Table. 3

Table 3: Effect on Dyspnoea in patients of *Tamaka Svasa* in *Dhumapana* Group:

Mean		Difference In Means	Paired 't' test			
B.T.	A.T.		S.D.	S.E.M.	't'	P
2.000 (±0.667)	1.200 (±0.632)	0.800	0.632	0.200	4.000	=0.003

Effect on Dyspnoea in patients of *Tamaka Svasa* in *Svasakutara* Group: Oral administration of *Svasakutara rasi* was found to be effective in relieving dyspnoea in patients suffering from *Tamaka Svasa*. The initial score of dyspnoea, which was 2.0 before

the treatment, came down to 1.3 following the treatment. The paired t- test showed that this change after the treatment is statistically significant. Table 4 shows the full account of the statistical analysis.

Table 4: Effect on Dyspnoea in patients of Tamaka Svasa in Svasakutara Group:

Mean		Difference In Means	Paired 't' test			
B.T.	A.T.		S.D.	S.E.M.	't'	P
2.000 (±0.00)	1.300 (±0.675)	0.700	0.675	0.213	3.280	=0.010

Effect on Speech in patients of Tamaka Svasa in Dhumapana Group: The difficulty Speech in patients suffering from *Tamaka Svasa* showed an improvement in once ability to speak following the *Dhumapana* therapy. The initial mean score of severity of

speech was 2.0 and this came down to 1.3 after the treatment. The statistical analysis with paired t- test showed highly significant improvement by the treatment (P=0.001). The details of the same are given in the Table 5.

Table 5: Effect on Speech in patients of Tamaka Svasa in Dhumapana Group:

Mean		Difference In Means	Paired 't' test			
B.T.	A.T.		S.D.	S.E.M.	't'	P
2.000 (±0.816)	1.300(±0.483)	0.700	0.483	0.153	4.583	=0.001

Effect on Speech in patients of Tamaka Svasa in Svasakutara Group: Statistically significant improvement was observed in speech after the medication with *Svasakutara rasa* (P=0.015). The mean score

of severity of speech was 1.7 before the treatment. This initial score came down by 0.5 following the treatment. Statistical details are shown in the Table 6.

Table 6: Effect on Speech in patients of Tamaka Svasa in Svasakutara rasa Group:

Mean		Difference In Means	Paired 'T' Test			
B.T.	A.T.		S.D.	S.E.M.	'T'	P
1.700 (±0.483)	1.200 (±0.422)	0.500	0.527	0.167	3.000	=0.015

Effect on Cough in patients of Tamaka Svasa in Dhumapana Group: The symptom cough was reduced after the administration of *Dhumapana*. Before the therapy the mean severity score of cough was 2.4.

This then came down to 1.4 following the treatment. As shown in the Table 7 the statistical analysis with paired t -test proved significant improvement by the treatment (P=0.001).

Table 7: Effect on Cough of Tamaka Svasa in Dhumapana Group:

Mean		Difference In Means	Paired 't' test			
B.T.	A.T.		S.D.	S.E.M.	't'	P
2.400 (±0.843)	1.400 (±0.699)	1.000	0.471	0.149	6.708	<0.001

Effect on Cough in patients of Tamaka Svasa in Svasakutara rasa Group: Remission of the symptom cough was observed following the medication with *Svasakutara rasa* in 10 patients suffering from *Tamaka Svasa*. The mean score of severity before the treatment was 1.7 and this then reduced to 1.5 after the medication for a stipulated period. Even then the paired t- test could not confirm the statistical significance of this change (P=0.555).

Effect on Sputum in patients of Tamaka Svasa in Dhumapana Group: The administration of *Dhumapana* was found to be very effective in reducing the amount of sputum in patients suffering from *Tamaka Svasa*. The initial severity score of sputum which was 2.2 came down to 1.3 following the treatment. This improvement was also statistically highly significant as depicted in the Table 8. (P<0.001).

Table 8: Effect on Sputum in patients of Tamaka Svasa in Dhumapana Group:

Mean		Difference In Means	Paired 't' test			
B.T.	A.T.		S.D.	S.E.M.	't'	P
2.200 (±0.632)	1.300 (±0.675)	0.900	0.316	0.100	9.000	<0.001

Effect on Sputum in patients of Tamaka Svasa in Svasakutara rasa Group: Administration of *Svasakutara rasa* has not shown reduction in the amount of sputum following medication. The initial symptom

score of sputum was 1.6 that then rose to 2.0 after the treatment. However, this change could not be proved to be significant by the statistical methods ($P < 0.223$) as shown in the Table 9.

Table 9: Effect on Sputum in patients of Tamaka Svasa in Svasakutara Group:

Mean		Difference In Means	Paired 't' test			
B.T.	A.T.		S.D.	S.E.M.	't'	P
1.600 (±0.843)	2.000 (±0.471)	-0.40	0.966	0.306	-1.309	=0.223

Effect on Body Position in patients of Tamaka Svasa treated with Dhumapana: The Body position indicating the severity of breathlessness showed remission following the *Dhumapana*. The initial score of severity of body position before the treatment was 1.9

that came down to 1.1 after the treatment. Analysis of the results by the paired t-test proved that the improvement is statistically significant. ($P < 0.001$) as shown in the Table 10.

Table 10: Effect on Body Position in patients of Tamaka Svasa treated with Dhumapana

Mean		Difference In Means	Paired 't' test			
B.T.	A.T.		S.D.	S.E.M.	't'	P
1.900 (±0.568)	1.100 (±0.738)	0.800	0.422	0.133	6.000	<0.001

Effect on Body Position in patients of Tamaka Svasa in Svasakutara rasa Group: The administration of *Svasakutara rasa* has shown improvement in body position indicating remission of *Tamaka Svasa*. The mean score of body position that was 1.1 before the

treatment reduced to 0.1 following the treatment. However, the improvement is not statistically significant ($P = 0.343$) the change may be due to chance factor also as shown in the Table 11.

Table 11: Effect on Body Position in patients of Tamaka Svasa in Svasakutara Group:

Mean		Difference In Means	Paired 't' test			
B.T.	A.T.		S.D.	S.E.M.	't'	P
1.100 (±0.316)	1.000 (±0.000)	0.100	0.316	0.100	1.000	=0.343

Effect on Respiratory rate in patients of Tamaka Svasa in Dhumapana Group: The mean Respiratory rate showed a reduction following the treatment with *Dhumapana*. The initial mean score of 2.1 came down

to 1.3 following the treatment. This change is found to be statistically significant as proved by the paired t-test ($P = 0.003$). Details are given in the Table 12.

Table 12: Effect on Respiratory rate in patients of Tamaka Svasa in Dhumapana Group:

Mean		Difference In Means	Paired 't' test			
B.T.	A.T.		S.D.	S.E.M.	't'	P
2.1 (±0.568)	1.3 (±0.483)	0.800	0.632	0.200	4.000	=0.003

Effect on Respiratory rate in patients of Tamaka Svasa in Svasakutara rasa Group: The oral administration of *Svasakutara rasa* has significantly brought down the rate of respiration. The study revealed that the mean score of respiratory rates, which was 2.2 before the treatment, came down to 1.5 following treatment. Further this change was proved to be statistically significant by the paired t test (P=0.025).

Effect on Labored Breathing in Dhumapana Group: Statistically significant improvement was seen in the symptom labored breathing. (P=0.015). The initial mean score of labored breathing was 1.5 that came down to 1.0 following the medication. The Table13 gives the details.

Table 13: Effect on Labored Breathing in Dhumapana Group:

Mean		Difference In Means	Paired 't' test			
B.T.	A.T.		S.D.	S.E.M.	't'	P
1.500 (±0.527)	1.000 (±0.471)	0.500	0.527	0.167	3.000	=0.015

Effect on Labored Breathing in Svasakutara Group: A reduction by 1.0 in the mean score of labored breathing was observed following treatment with *Svasakutara rasa*. This improvement was also statistically highly significant as proved by the paired t- test (P<0.001).

breath sounds showed an improvement following employment of *Dhumapana*. A reduction by 0.5 in the mean score of Breath sounds from the initial score of 2.1 explains the comfort of breathing in patients of *Tamaka Svasa* following *Dhumapana*. The improvement by the medication was also proved to be statistically significant (P<0.015) Table14.

Effect on Breath Sounds in patients of Tamaka Svasa in Dhumapana Group: The audibility of the

Table 14: Effect on Breath Sounds of Tamaka Svasa in Dhumapana Group:

Mean		Difference In Means	Paired 't' test			
B.T.	A.T.		S.D.	S.E.M.	't'	P
2.100 (±0.738)	1.600 (±0.516)	0.500	0.527	0.167	3.000	=0.015

Effect on Breath Sounds in patients of Tamaka Svasa in Svasakutara Rasa Group: The assessment of breath sounds showed an improvement following the oral administration of *Svasakutara rasa*. The mean score of breath sounds was 1.7 and 1.0 before and after treatment respectively there by showing a reduction in the mean score by 0.7. Statistical significance of this improvement was also confirmed by the paired t- test (P <0.001).

FVC, FEV1. PEF and FEV1/FVC were assessed before and after the treatment. The result showed that there was an increase in the lung volumes following the treatment with *Dhumapana*. The absolute value of the FVC which was 1.856 before the treatment rose to 2.188 following the medication. This improvement was also proved to be statistically highly significant (P=0.001). The Spirometric evaluation of other absolute values of the lung volume showed statistically significant improvement. Table 15 shows the details of the statistical analysis.

The spirometric results in dpg and SKG Groups

Effect on Spirometric Parameters of assessment in *Dhumapana* Group (Absolute value):

Table 15: Effect on Spirometric Parameters of assessment

Parameters	B.T (mean & ±SEM)	A.T (mean ±SEM)	S.D	S.E	't'	P
FVC Forced vital Capacity	1.856±0.275	2.188±0.268	0.226	0.716	-4.639	=0.001
FEV1 Forced Exp Volume in 1 sec	1.226±0.245	1.576±0.234	0.384	0.121	-2.884	=0.018
PEF Peak expiratory Flow	1.828±0.382	2.809±0.531	0.593	0.188	-5.229	<0.001
FEV1/FVC% FEV1 as % of FVC	66.850±6.241	72.010±4.238	16.982	5.370	-0.961	=0.362

Effect of Dhumapana on the predicted percentage values of spirometric evaluation: The percentage prediction of the lung volumes as assessed by the spirometer showed definite improvement in patients treated with *Haridra Dhumapana*. The % prediction of FVC was 51.69 before treatment that rose to 61.24 following *Dhumapana*. Also, the FEV1 showed

marked improvement in the percentage prediction of this volume by the medication. The initial value of the FEV1 was 35.56 and which elevated to 51.43 following *Dhumapana*. All the spirometric values that showed increase following medication was also found to be statistically significant as assessed by paired t-test. The details of the same are given in the Table 16.

Table 16: Effect of Dhumapana on the predicted percentage values of spirometric evaluation.

Parameters	B.T (mean & ±SEM)	A.T (mean ±SEM)	S.D	S.E	't'	P
FVC Forced vital Capacity	51.690±5.757	61.240±5.786	6.187	1.957	-4.881	<0.001
FEV1 Forced Exp Volume in 1 sec	39.560±5.851	51.430±5.766	12.325	3.898	-3.045	=0.014
PEF Peak expiratory Flow	24.730±4.641	38.260±6.563	8.335	2.636	-5.133	<0.001
FEV1/FVC% FEV1 as % of FVC	82.340±7.858	88.200±4.888	20.538	6.495	-0.902	=0.390

Effect on Spirometric Parameters of assessment in Svasakutara rasa Group: The Absolute values of lung volumes as assessed by the spirometer showed improvement in regard to FVC, PEF and FEV1/FVC% when treated with *Svasa* -kutara Rasa. In contrast to this the FEV1 showed a marginal reduction. The initial value of FVC was 1.90 which then increased to 2.06 following medication. However, this change was statistically insignificant. The marginal improvement recorded in this group following treatment could not be affirmed by the statistical analysis.

Effect on the predicted percentage values of spirometric evaluation in SKG: The percentage predicted

values of the lung volume also showed marginal improvement following treatment by the *Svasakutara rasa* as assessed by the spirometer. All the parameters which included FVC, FEV1, PEF and FEV1/FVC% showed improvement following treatment. The initial value of percentage prediction of FVC was 54.34 and the same rose to 59.30 following medication with *Svasakutara rasa*. The other spirometric results also showed similar tendency of increase. However, the statistical analysis revealed that these changes happened may be because of chance factor or due to sampling variability. The details are shown in the Table 17.

Table 17: Effect on the predicted percentage values of spirometric evaluation in SKG.

Parameters	B.T (mean & ±SEM)	A.T (mean ±SEM)	S.D	S.E	't'	P
FVC Forced vital Capacity	54.340±4.632	59.300±4.233	9.658	3.054	-1.624	=0.139
FEV1 Forced Exp Volume in 1 sec	39.580±4.292	45.440±3.800	8.039	2.542	-2.305	=0.047
PEF Peak expiratory Flow	26.220±3.314	32.180±4.176	7.942	2.511	-2.373	=0.042
FEV1/FVC% FEV1 as % of FVC	75.240±4.139	79.930±5.251	16.946	5.359	-0.875	=0.404

Overall effect of Dhumapana and Svasakutara rasa in patients of Tamaka Svasa: After the completion of

the 10 days course of medication in the two groups the overall assessment of the patients was made as dis-

cussed in the assessment criteria. The analysis revealed that no patients recorded complete relief both in the *Dhumapana* group and *Svasakutara rasa* group. Moderate remission of the illness was found in 20 % of the patients in *Dhumapana* group. Contrary to this, no patients showed moderate remission in the *Svasakutara rasa* group. 40 % of the patients recorded aver-

age remission in patients treated with *Dhumapana* as against 50 % of the patients showing the same average remission in the *Svasakuthara Rasa* group. No remission of the illness was observed in 40% and 50% of patients in *Dhumapana* group and *Svasakutara rasa* group respectively as shown in the Table 18.

Table 18: Overall effect in two groups:

Effect	DPG	%	SKG	%	Total	%
Complete remission	0	0	0	0	0	0
Moderate remission	2	20	0	0	2	10
Average remission	4	40	5	50	9	45
No remission	4	40	5	50	9	45

DISCUSSION

The principles of treatment that are adapted in *Tamaka Svasa* include *Sodhana*, *Samana*, *Bruhmana* and *Rasayana cikitsa*. *Tamaka Svasa* is typically an episodic illness. Therefore, the treatment differs during the attack of *Tamaka Svasa* and in between the attacks. Liquefaction of the *Sleshma*, expectoration of the sputum and *Srotomardava Cikitsa* forms the key treatment during the attack of the illness. This is achieved by *Abhyanga* and *Swedana* of the chest, then *Kapha utklesana Ahara* followed by *Vamana*, then followed by *Dhumapana* and *Shamana* treatment. These therapeutic procedures remove the *Sleshma* obstructing the *Pranavayu*, as well as render *Mardava* of *Pranavaha Srotas* facilitating free movement of *Pranavayu* in the *Pranavaha Srotas*. In between the attacks, the treatment is planned to prevent the further attacks, to eliminate the *Kha-vaigunyata*, and to improve the immunity of the *Pranavaha Srotas*. This is achieved by *Virecana karma*, *Bruhmana Cikitsa* and *Rasayana cikitsa*.

The purpose of *Shamana Cikitsa* is to ensure *Kapha vilayana*, *Kapha Nissarana*, *Kasaghna*, *Srotho mardavakarana*, *Vatahara*, *Kaphahara* and *Brumhana* effects and is mostly achieved by the oral medication. Considering these principles of treatment, the *Dhumapana* and oral medication with *Svasakutara rasa* is taken for this study. To evaluate the effect of this Herbal combination in patients of *Tamaka Svasa*, this

single blind comparative clinical study is planned. Test group patient are subjected to *Dhumapana* and oral medication with *Svasakutara Rasa*. A control group treated with *Svasakutara rasa* in prescribed doses is maintained to assess the effect of the treatment.

CONCLUSION

Among the 20 patients taken for this study maximum number of patients belonged to the age group of 12 to 24 years. Remission of the severity of the illness was recorded in both the *Dhumapana* and *Svasakutara* groups. Improvement observed in the *Dhumapana* group was statistically highly significant ($P < 0.001$). While in *Svasakutara* group, though improvement was observed the statistical analysis by the paired t- test proved insignificant, Best improvement was recorded in the *Dhumapana* group in comparison to the *Svasakutara rasa* group in the mental status of the patients suffering from *Tamaka Svasa*. However, the unpaired t- test did not show statistically significant change in two groups when compared ($P = 0.250$). FVC, FEV1, PEF and FEV1/FVC were assessed before and after the treatment. The result showed that there was an increase in the lung volumes following the treatment with *Dhumapana*. The absolute value of the FVC which was 1.856 before the treatment rose to 2.188 following the medication. This improvement was also proved to be statistically highly significant ($P = 0.001$).

The spirometric evaluation of other Absolute values of the lung volume showed statistically significant improvement. The analysis revealed that no patients recorded complete relief both in the *Dhumapana* group and *Svasakutara Rasa* group.

Moderate remission of the illness was found in 20 % of the patients in *Dhumapana* group. Contrary to this no patients showed moderate remission in the *Svasakutara rasa* group. 40 % of the patients recorded average remission in patients treated with *Dhumapana* as against 50 % of the patients showing the same average remission in *Svasakutara Rasa* group. No remission of the illness was observed in 40% and 50% of patients in *Dhumapana* group and *Svasakutara rasa* group respectively. The total duration of the treatment in both the groups was 10 days. During this period of medication none of the patients developed any untoward symptoms that can be labeled as side effect. Therefore, the medication in this therapeutic *Doshage* seems to be safe. Form the above citations it is clear that the treatments in both the groups have resulted in improvement in regard to almost all the criteria of assessment. *Sroto mardavakarana*, *Kapha harana*, *Kapha vilayana*, *Kapha nissarana* and *Kasaghna* are the therapeutic effects of medication that are essential for the remittance of the illness. These therapeutic effects ensure clarity of the air passages reverting the Pranavilomata of *Tamaka Svasa*. The reduction in all the criteria of assessment implies that this would be a complete treatment. The showed that the improvement in patients suffering from *Tamaka Svasa* was better in patients treated with *Dhumapana* in comparison to the patients treated with *Svasakutara rasa*. This is to say that the combination treatment of *Dhumapana* and *Svasakutara rasa* in test group is more efficacious than the oral medication of *Svasakutara rasa* alone. This research work is presented with the hope that this will further widen the scope for further research and advancement in this aspect of Ayurvedic medicine, for the betterment of mankind.
